Hello Linux Geeksters. The latest Fedora versions should come with SSH pre-installed, **so in order to SSH to and from your Fedora, you only have to enable the SSHD service:**

```
$ sudo systemctl enable sshd.service
```

If however, you don't have SSH installed or you have removed it, you need to install the openssh package via yum, to get it back. The openssh package installs both openssh-server and openssh-clients packages:

And of course, enable the SSHD service at boot:

```
$ sudo yum install openssh
```

```
$ sudo systemctl enable sshd.service
```
